Gold to silver ratio: a daily log

How many grams of silver does a gram of gold buy today, and how does that ratio move?

1 Use it in 4 steps

1. One line per day: the date, the price of 1 g of 24K gold and of 1 g of 999 silver (local, the same kind: both selling or both buying).
2. For the world ratio, type the price of an ounce of gold and an ounce of silver in US dollars.
3. The sheet works out both ratios.
4. The ratio describes the market; it is not a recommendation. Delete the "Example" rows before you start.

2 The calculation

1. Local ratio = price of 1 g of 24K gold ÷ price of 1 g of 999 silver.
2. World ratio = price of an ounce of gold ÷ price of an ounce of silver (if you type them).
3. The ratio tells you how many grams of silver a gram of gold is worth. It does not say what will happen.

3 Worked example Example

Day	1 g of 24K gold (EGP)	1 g of 999 silver (EGP)	Local ratio	World ratio
Example: day 1	7,032.37	88.08	79.8	80.0
Example: day 2	7,065.00	89.10	79.3	79.3
Example: day 3	7,040.00	87.60	80.4	0.0

4 The table: fill it in by hand

Day	1 g of 24K gold (EGP)	1 g of 999 silver (EGP)	Gold ounce (USD), optional	Silver ounce (USD), optional	Local ratio
